This is a simple 32bit binary file that was created with Microsoft Visual Studio C++. It is comprised of two files: the source code and the linker's output (.OBJ file). As a result of the

assembler
optimizations
used to make this
binary file, all of
the program's
instructions are
stored in the file
which means that
it is very easy to
read instructions
directly by looking
at the binary file.
For example, in
order to figure out

what instructions
my program uses
for division, one
need only look at
the binary file (findPrimeFactors.exe > findPrimeFactors.txt).

Examples: findPrimeFactors.exe

2000 outputs

536870913 findPrimeFactors.exe

100 outputs 1000

In order to determine what instructions my program uses for "multiplication by 2", we need only look at the binary file (findPrimeFactors.exe > multiplyBy2.txt). I intentionally left out any instructions for looping which is

good for memory usage. This is because the output file will already contain instructions for the loop (which is redundant when there is already a loop defined in the source code). That being said, the source code looks something

like this: `main() {
 unsigned int a; //,
 b; // Initialize both
 a and b. // Loop
 until the user
 specified number
 is 1000 (or less).
 while (a`

`findPrimeFactors`

is a utility that's designed to quickly find all the factors of the number specified by the user. The main advantage of the utility is that it allows finding prime factors without exceeding a user-defined time interval. And, to

ensure that the process is efficient, the utility implements a simple and quick method to find the largest prime factor of the number. And, in the case of numbers that do not have a large prime factor, it uses an algorithm

developed by the utility to find the prime factors in a very fast way. The utility can be used to find the prime factors of integer
